

6 Covers

6.3.7 Ventilated covers

Ventilated covers are specifically meant for **hot environments** and conditions in which **hot material is handled**.

This system grants a good air circulation under the cover, thus decreasing the belt temperature and its hardness, so making its life longer.

These covers reduce the powder suspension in the air and the possible risks of explosion.

They are an excellent solution against corrosion problems in case of close and very wet environments.

Ventilated covers reduce and eliminate condensation.

The fixing components are the same as for standard covers.

The mounting is modular, namely: 1 ventilated cover every 2 covers or every 3 covers etc...

In order to ensure no ingress of water the covers must be overlapped by at least two waves.
